## SHS3 Hinged Safety Switches

Combines the hinge and safety
functions in one unit

SHS3 Series
Metal \& Plastic Body
With Up To 3 Contacts

## SHS3 Hinged Safety Switches Combines the hinge and safety functions in one unit

With the SHS3 safety hinge switch we present the logical further development of the SHS series and a solution that makes it unnecessary to replace the safety hinge switch when equipment such as safety gates are damaged as the result of mechanical stress, such as after being bumped by a forklift truck for instance. Even after the switching point has been set, if need be, the user can now correct the hinge setting with the aid of the integrated fine adjustment system. The SHS3 hinge switch is reusable even when the entire system needs to be converted: With the aid of a change kit, the user can redefine the switching point without using the high protection rating of IP67 / IP69 K.

The SHS3 has a swivel range from $0^{\circ}$ to $270^{\circ}$. The switching point is also freely selectable within this range.

## Reliable:

- The protection rating is IP67 / IP69 K
- The load-bearing hinge is made from stainless steel while the switching system is housed in a high quality plastic enclosure

The SHS3 hinge switch has virtually no limits in terms of its installation flexibility. Not only does the SHS3 enable front and interior installation, right-hinged or left-hinged mounting or freely selectable direction of electric connection, but thanks to the switching point which can be set in an angle range of $270^{\circ}$, this hinge switch can also be installed in places that were previously not possible.

## Safe:

With suitable system layout, the switch can be used up to performance level e. Following variants are available:

- 2 positive opening safety contacts - 2
positive opening safety contacts
with additional normally-open signalling contact
- With integrated AS interface Safety at Work.

## Flexible:

- Freely and repeatedly adjustable switching point
- Switching point freely adjustable by user over a range of $270^{\circ}$
- Uncomplicated re-adjustment even of set switching point by $\pm 1.5^{\circ}$ thanks to integrated fine adjustment system
- Slots for mounting on sections and welded structures
- In addition to the plug connection version, an SHS with fixed cable connection at the rear is also available
- Right and left hinged systems possible for optimum cable routing
- Mounting between sections while maintaining the required finger guard gap
us

## Double hinge

Thanks to its two switching elements on one hinge, the BG (occupational health and safety)-approved variant of the SHS3 provides two independently adjustable switching points. This arrangement not only makes it possible to monitor the opening of a safety guard but also the direction of opening of swing doors.

## SHS3 Hinged Safety Switches

## Combines the hinge and safety

 functions in one unitSHS3 - Setting the switching point

On delivery, the SHS3 hinge switch allows for all possible settings. With your specific application you define and lock the safe status of the hinged safety equipment (the closed position) (Fig. 1).

The adjusting screw located in axial direction in the switching system is then tightened with the special bit supplied with the hinge switch. The arrangement of the adjusting screw makes it possible to adjust the switching point in all installation positions (Fig. 2+3)

After establishing a form-fit connection, a green ring in the gap between the stainless steel hinge and switch enclosure indicates that the switching point has been set correctly at a min. torque of $2 \mathrm{Nm} /+10 \%$ (Fig. 4).

A red ring at this point additionally indicates wear, e.g. caused by abrasive substances. With the same special bit you can not only freely adjust the switching point to suit your application but you can also change the mounting arrangement of your safety equipment from right-hinged to left-hinged (Fig. 5).

## Dimensioned drawings

SHS3...KA...

SHS3...KR...

133

## Fine adjustment

The set switching point can be subsequently varied by up to $\pm 1.5 \%$ by turning the adjusting screw in the corresponding direction (Fig. 6).

In many cases this fine adjustment makes it unnecessary to replace the switch or readjust the switching point due to mechanical deformation of the safety guard. The switching angle should generally be selected as small as possible.

## Switching diagram
